CMS Measurements of the top quark mass, including alternative techniques and differential measurements

Friday, 4 July 2014 12:20 (20)

Result of abstract merging:

Measurements of the top quark mass are presented using data collected by the CMS experiment in proton-proton collisions at the LHC at centre-of-mass energies of 7 and 8 TeV. Analyses in several decay channels of top quark pair events are employed to determine the top quark mass. The results are combined and compared to the world average.

Measurements of the top quark mass employing alternative methods are presented using data collected by the CMS experiment in proton-proton collisions at the LHC in the years 2011 and 2012 at centre-of-mass energies of 7 and 8 TeV. The alternative methods include the use of endpoint distributions as well as the study of possible model dependencies of the top mass measurement on the event kinematics. Measurements of the difference between the masses of top and anti-top quarks are also presented. Furthermore, the top quark mass, and also α_s are extracted from the measured top quark pair cross section.

Summary

Primary author(s) : MEYER, Arnd (RWTH Aachen University)

Presenter(s) : Dr. WALLNY, Rainer (ETH Zürich, Switzerland)

Session Classification : Top-quark and ElectroWeak Physics

Track Classification : Top-quark and ElectroWeak Physics
