## Searches for vector-like quarks, $t\bar{t}$ and $t\bar{b}$ resonances with the ATLAS detector

*Saturday, 5 July 2014 11:45 (15)*

Various extensions of the Standard Model predict the existence of new types of quarks. We report on several search channels such as vector-like quarks decaying to a Higgs boson and a top quark or to a W boson and a b quark. The talk presents results from searches for new resonances decaying to a top-antitop pair and a top-antibottom pair, including the use of boosted top quark reconstruction techniques. These searches use the data sample recorded in 2012 at  $\sqrt{s}=8$  TeV centre-of-mass energy by the ATLAS experiment at the LHC.
