

JOINT ν_μ DISAPPEARANCE AND ν_e APPEARANCE ANALYSIS IN T2K WITH A FREQUENTIST APPROACH

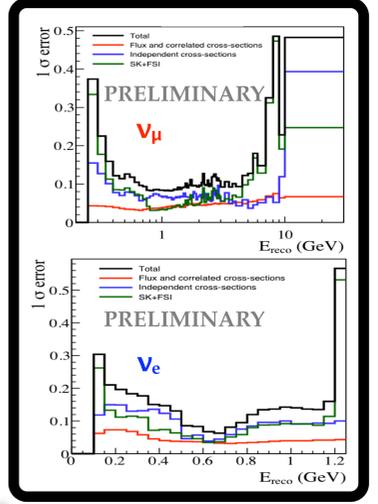

Lorena Escudero (loressa@ific.uv.es) for the T2K Collaboration

SYSTEMATIC UNCERTAINTIES

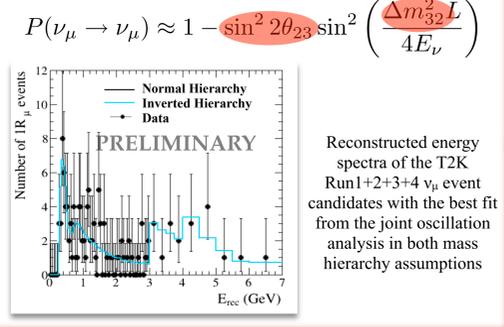

EFFECT OF SYSTEMATICS

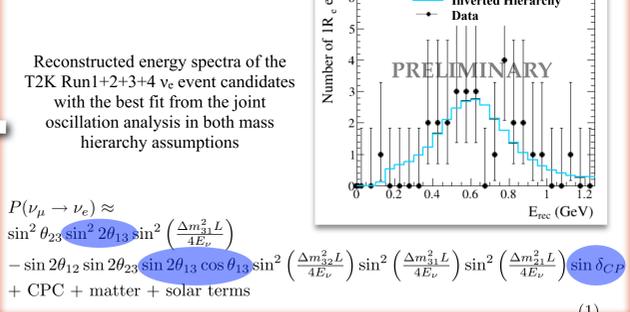

JOINT OSCILLATION ANALYSIS

ν_μ DISAPPEARANCE

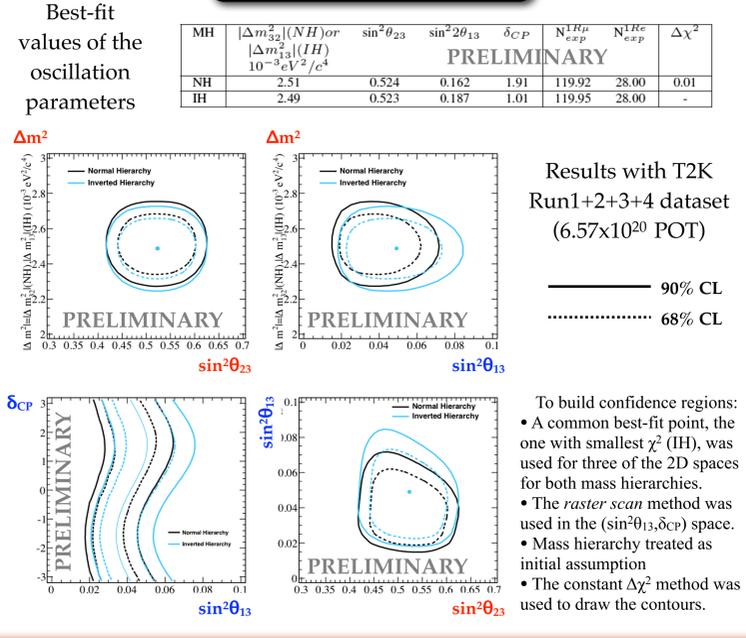

ν_e APPEARANCE

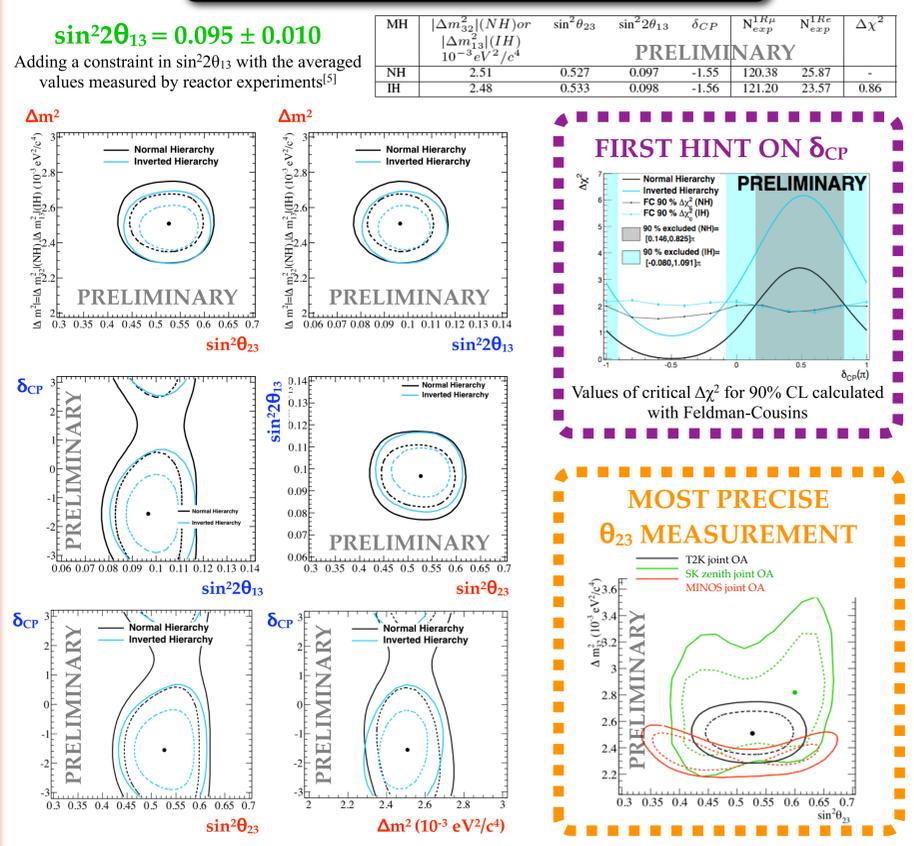

It is a **simultaneous fit** of the 4 oscillation parameters $\sin^2 \theta_{23}$, $\sin^2 \theta_{13}$, Δm^2 & δ_{CP} in a 3 flavour framework including matter effects, taking their dependencies into account and fitting at the same time the **reconstructed spectra** of the SK ν_μ & ν_e samples by minimizing the **likelihood ratio**

RESULTS

T2K DATA ONLY

T2K + REACTOR CONSTRAINT

CONCLUSIONS

With only ~8% of its goal POT, T2K has achieved world leading results: the best precision in θ_{23} ^[4], the strongest evidence of ν_e appearance in a ν_μ beam^[3] and the first hint on δ_{CP} . It has also performed its first $\nu_\mu + \nu_e$ joint analysis, in which the high ν_e appearance rate observed, combined with the ν_μ disappearance measurement and the results from reactor experiments, indicates that δ_{CP} is consistent with $-\pi/2$.
