

# ASTROFÍSICA NUCLEAR (EXPERIMENTAL)

*Visión general y algunos ejemplos*

César Domingo Pardo

# Outline

- Introducción
- X-ray bursts: rp-process
- Heavy elements nucleosynthesis: the slow (s-) and the rapid (r-) neutron capture processes
- R-process in core collapse supernovae: experiments with radioactive ion beams
- S-process in massive stars: neutron capture measurements

# Outline

BRAINSTORMING

# The context of (experimental) nuclear astrophysics

En química:

Estructura atómica (e- valencia) → Reacciones químicas

+

=

# En astrofísica: Estructura nuclear → Reacciones nucleares (NUCLEOSÍNTESIS)

$$\langle \sigma v \rangle = \left( \frac{2\pi}{\mu kT} \right)^{3/2} \hbar^2 \sum_i (\omega \gamma)_i \exp \left( \frac{-(E_{R,i}^{CM})}{kT} \right)$$

La estructura cuántica del núcleo determina la tasa de producción (nucleosíntesis) estelar

La estructura nuclear determina las reacciones nucleares que pueden dar lugar a nuevos isótopos, nuevos núcleos, nuevos elementos.

 $kT=90$  keV  
 $10^{11}-10^{12} \text{ cm}^{-3}$

$^{22}\text{Ne}(^4\text{He},n)^{25}\text{Mg}$

**(n, $\gamma$ ) Cross Sections**

## How to bring AGB and Massive Stars to the lab?

→ Neutron beam facility with neutron energies similar to the stellar environment

→ Sample of the isotope of interest (stable or radioactive)

→ Neutron beam facility with neutron energies similar to the stellar environment

→ Sample of the isotope of interest (stable or radioactive)

**BRAINSTORMING**

# CERN n\_TOF facility

C. Rubbia et al., *A high resolution spallation driven facility at the CERN-PS to measure neutron cross sections in the interval from 1 eV to 250 MeV*, CERN/LHC/98-02(EET) 1998.

# CERN n\_TOF facility

# $(n,\gamma)$ Cross sections via prompt $\gamma$ -ray(s) detection

BaF<sub>2</sub> Total Absorption Calorimeter (TAC)

C<sub>6</sub>D<sub>6</sub> based Total Energy Detector (TED)

# $(n,\gamma)$ Cross sections via prompt $\gamma$ -ray(s) detection

BaF<sub>2</sub> Total Absorption Calorimeter (TAC)

C<sub>6</sub>D<sub>6</sub> based Total Energy Detector (TED)

# Example: Temperature in TP AGB Stars

## TP-AGB stars 1-3 $M_{\odot}$

shell H-burning

$0.9 \cdot 10^8$  K

$kT=8$  keV

$10^7$ - $10^8$  cm $^{-3}$

$^{13}\text{C}(^4\text{He},n)^{16}\text{O}$

He-flash

$3$ - $3.5 \cdot 10^8$  K

$kT=23$  keV

$10^{10}$ - $10^{11}$  cm $^{-3}$

$^{22}\text{Ne}(^4\text{He},n)^{25}\text{Mg}$

# Temperature in TP AGB Stars

- How **hot** is the stellar environment where s-process nucleosynthesis takes place?

$N_{s,152\text{Gd}}$  &  $N_{s,154\text{Gd}}$

# Temperature in TP AGB Stars

- How **hot** is the stellar environment where s-process nucleosynthesis takes place?

$$f_{\beta} = \frac{(\langle \sigma_{\gamma} \rangle N_s)_{152\text{Gd}}}{(\langle \sigma_{\gamma} \rangle N_s)_{154\text{Gd}}} = \frac{\lambda_{\beta}^{151\text{Sm}}(T)}{\lambda_{\beta}^{151\text{Sm}} - v_T n_n \langle \sigma_{\gamma} \rangle_{151\text{Sm}}}$$

→ Just measure  $\langle \sigma_{\gamma} \rangle_{151\text{Sm}}$

$N_{s,152\text{Gd}}$

**First challenge:**  
 **$^{151}\text{Sm}$  does not exist in Earth!!!**

# Temperature in TP AGB Stars

## ILL Grenoble

→  $\Phi_n = 1.5 \times 10^{15} \text{ n/cm}^2/\text{s}$

→ few grams of  $^{150}\text{Sm}$

# Temperature in TP AGB Stars

$$\text{MACS-30} = 3100 \pm 160 \text{ mb}$$

$$T_{\text{He}} = 2.5\text{-}2.8 \times 10^8 \text{ K}$$

$$T_{\text{H}} = 1 \times 10^8 \text{ K}$$
