Testing macroscopic realism with measurements of light polarization

miércoles, 19 de julio de 2017 18:05 (20)

We study Leggett-Garg inequalities and no-signaling in time to determine the macrorealistic character of light polarization. In particular we present a model based on photon extraction. We show that violations of macrorealism occur for sufficiently invasive measurements, while for sufficiently coarse-grained measurements violations vanish.

Primary author(s) : Prof. ROLDÁN SERRANO, Eugenio (Universitat de València)

Co-author(s) : Dr. NAVARRETE BENLLOCH, Carlos (Max-Planck-Institut für die Physik des Lichts, Erlangen); Dr. KOFLER, Johannes (Max-Planck-Institut für Quantenoptik, Garching)

Presenter(s) : Prof. ROLDÁN SERRANO, Eugenio (Universitat de València)

Clasificación de la sesión : Quantum and Non-linear Optics

Clasificación de temáticas : Quantum and Non-linear Optics
