Challenging and broad programmes are planned in several areas of physics research, such as such as astronomy, particle, nuclear, medical and applied physics for the coming decades. Those programmes requires large investments to build new facilities and experiments, or to upgrade existing ones. Similarly, they requires commensurate improvements in computational technologies to produce, manage, process, and analyse the foreseen amount of data. To face the computational challenges of the future physics projects, it is critical to develop a collaborative effort among all the Spanish groups involved, sharing the available infrastructures and know-how across different projects and areas of research. In this spirit, the present roadmap describes the infrastructures, activities and plans to prepare for computing challenges ahead.
