

# The impact of Galactic DM on annihilation signals from Sagittarius (and other dwarfs)

Evan Vienneau

Department of Physics

University of Alberta

Based on **arXiv:2403.15544** and **arXiv:2509.05519**

In Collaboration with N. Bozorgnia (supervisor), L. Strigari, O. Hartl, E. Batteas and A. Evans

# Sagittarius Dwarf Spheroidal

- The Sagittarius (Sgr) dwarf spheroidal is a nearby DM dominated galaxy
- Significant tidal disruption
- Hosts a population of globular clusters

# Sagittarius Dwarf Spheroidal

- The Sagittarius (Sgr) dwarf spheroidal is a nearby DM dominated galaxy
- Significant tidal disruption
- Hosts a population of globular clusters

# Sagittarius Dwarf Spheroidal

- The Sagittarius (Sgr) dwarf spheroidal is a nearby DM dominated galaxy
- Significant tidal disruption
- Hosts a population of globular clusters
- A gamma-ray source has been identified in the core, is it DM or MSPs?
- Simulations are necessary to extract DM distribution

[Evans et al. 22']

# Simulated Sgr Analogues

- Auriga is a suite of magneto-hydrodynamical zoom-in simulations of MW analogues

[Grand et al. 16']

# Simulated Sgr Analogues

- Auriga is a suite of magneto-hydrodynamical zoom-in simulations of MW analogues
- Six Sgr analogues are identified by matching bound stellar mass and galactocentric distance to observations

[Grand et al. 16']

# Indirect Detection J-Factor

$$\frac{d\Phi_\gamma}{dE} = \frac{(\sigma_A v_{\text{rel}})_0}{8\pi m_\chi^2} \frac{dN_\gamma}{dE} \int d\ell \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n [\rho(r(\ell, \theta))]^2$$

# Indirect Detection J-Factor

$$\frac{d\Phi_\gamma}{dE} = \frac{(\sigma_A v_{\text{rel}})_0}{8\pi m_\chi^2} \frac{dN_\gamma}{dE} \boxed{\int d\ell \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n [\rho(r(\ell, \theta))]^2}$$

J-Factor

# Indirect Detection J-Factor

$$\frac{d\Phi_\gamma}{dE} = \frac{(\sigma_A v_{\text{rel}})_0}{8\pi m_\chi^2} \frac{dN_\gamma}{dE} \boxed{\int d\ell \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n [\rho(r(\ell, \theta))]^2}$$

J-Factor

- DM density

$$[\rho(\mathbf{x})]^2$$

- n-th moment of relative velocity distribution

$$\mu_n(\mathbf{x}) = \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n$$

# Indirect Detection J-Factor

$$\frac{d\Phi_\gamma}{dE} = \frac{(\sigma_A v_{\text{rel}})_0}{8\pi m_\chi^2} \frac{dN_\gamma}{dE} \boxed{\int d\ell \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n [\rho(r(\ell, \theta))]^2}$$

J-Factor

- DM density

$$[\rho(\mathbf{x})]^2$$

**S-wave** ( $\ell = 0, n = 0$ )

- n-th moment of relative velocity distribution

$$\mu_n(\mathbf{x}) = \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n$$

# Indirect Detection J-Factor

$$\frac{d\Phi_\gamma}{dE} = \frac{(\sigma_A v_{\text{rel}})_0}{8\pi m_\chi^2} \frac{dN_\gamma}{dE} \boxed{\int d\ell \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n [\rho(r(\ell, \theta))]^2}$$

J-Factor

- DM density

$$[\rho(\mathbf{x})]^2$$

**S-wave** ( $\ell = 0, n = 0$ )

**P-wave** ( $\ell = 1, n = 2$ ) , e.g. Majorana spin 1/2

[Kumar & Marfatia 13']

- n-th moment of relative velocity distribution

$$\mu_n(\mathbf{x}) = \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n$$

# Indirect Detection J-Factor

$$\frac{d\Phi_\gamma}{dE} = \frac{(\sigma_A v_{\text{rel}})_0}{8\pi m_\chi^2} \frac{dN_\gamma}{dE} \boxed{\int d\ell \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n [\rho(r(\ell, \theta))]^2}$$

J-Factor

- DM density

$$[\rho(\mathbf{x})]^2$$

**S-wave** ( $\ell = 0, n = 0$ )

**P-wave** ( $\ell = 1, n = 2$ ) , e.g. Majorana spin 1/2

[Kumar & Marfatia 13']

- n-th moment of relative velocity distribution

$$\mu_n(\mathbf{x}) = \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n$$

**D-wave** ( $\ell = 2, n = 4$ ) , e.g. real scalar

[Giacchino 13']

# Indirect Detection J-Factor

$$\frac{d\Phi_\gamma}{dE} = \frac{(\sigma_A v_{\text{rel}})_0}{8\pi m_\chi^2} \frac{dN_\gamma}{dE} \boxed{\int d\ell \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n [\rho(r(\ell, \theta))]^2}$$

J-Factor

- DM density

$$[\rho(\mathbf{x})]^2$$

**S-wave** ( $\ell = 0, n = 0$ )

**P-wave** ( $\ell = 1, n = 2$ ) , e.g. Majorana spin 1/2

[Kumar & Marfatia 13']

- n-th moment of relative velocity distribution

**D-wave** ( $\ell = 2, n = 4$ ) , e.g. real scalar

[Giacchino 13']

$$\mu_n(\mathbf{x}) = \int d^3\mathbf{v}_{\text{rel}} P_{\mathbf{x}}(\mathbf{v}_{\text{rel}}) \left(\frac{v_{\text{rel}}}{c}\right)^n$$

**Sommerfeld** ( $n = -1$ ) , long range interaction

[Feng 10']

# Impact of unbound MW DM

- There are two populations of DM within a subhalo:
  - **DM that is bound to the subhalo**

## Density Profiles

## Relative Velocity Distribution

# Impact of unbound MW DM

- There are two populations of DM within a subhalo:
  - DM that is bound to the subhalo
  - **DM that is bound to the MW (not bound to subhalo)**

## Density Profiles

## Relative Velocity Distribution

# Impact of unbound MW DM

- There are two populations of DM within a subhalo:
  - DM that is bound to the subhalo
  - DM that is bound to the MW (not bound to subhalo)**

## Density Profiles

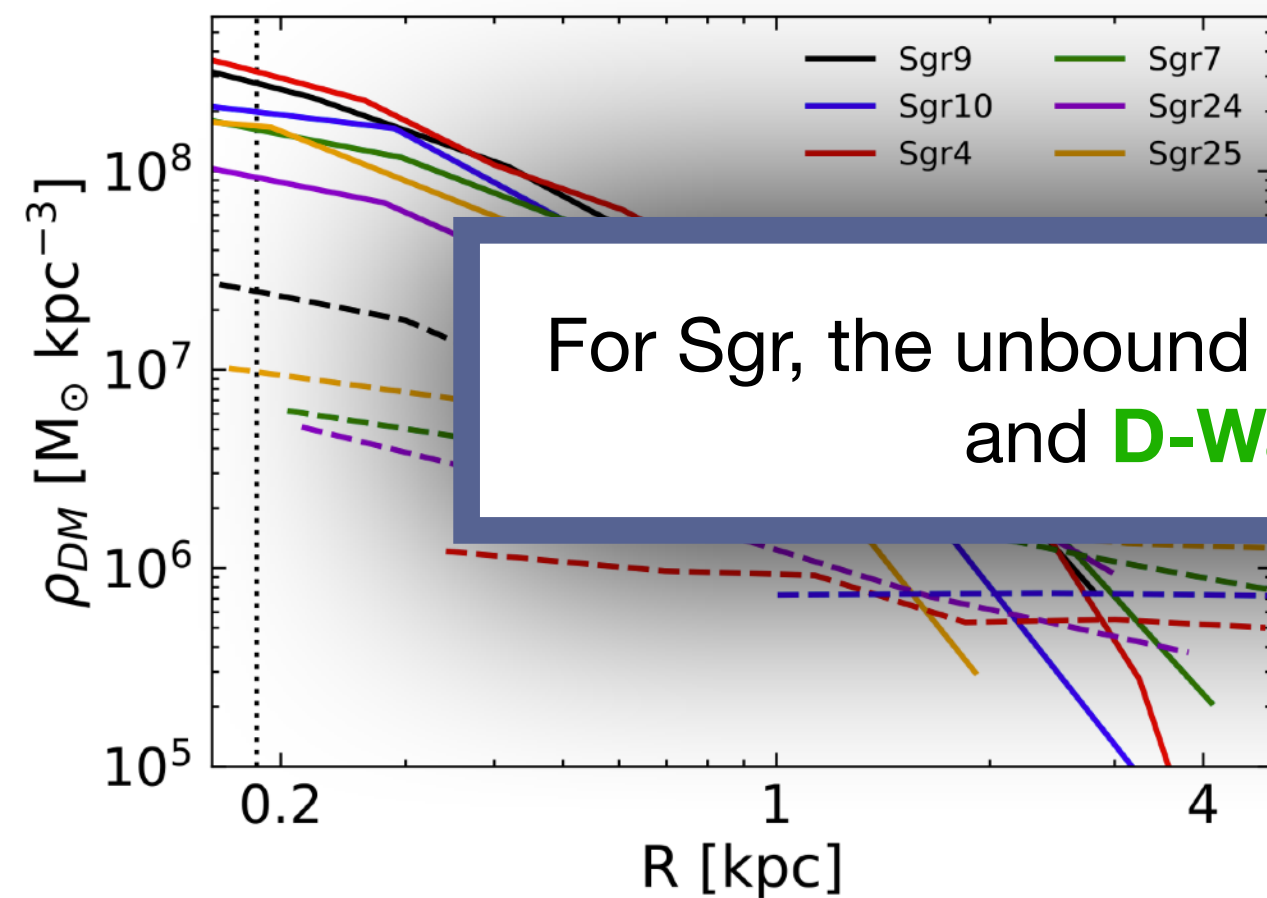

## Relative Velocity Distribution

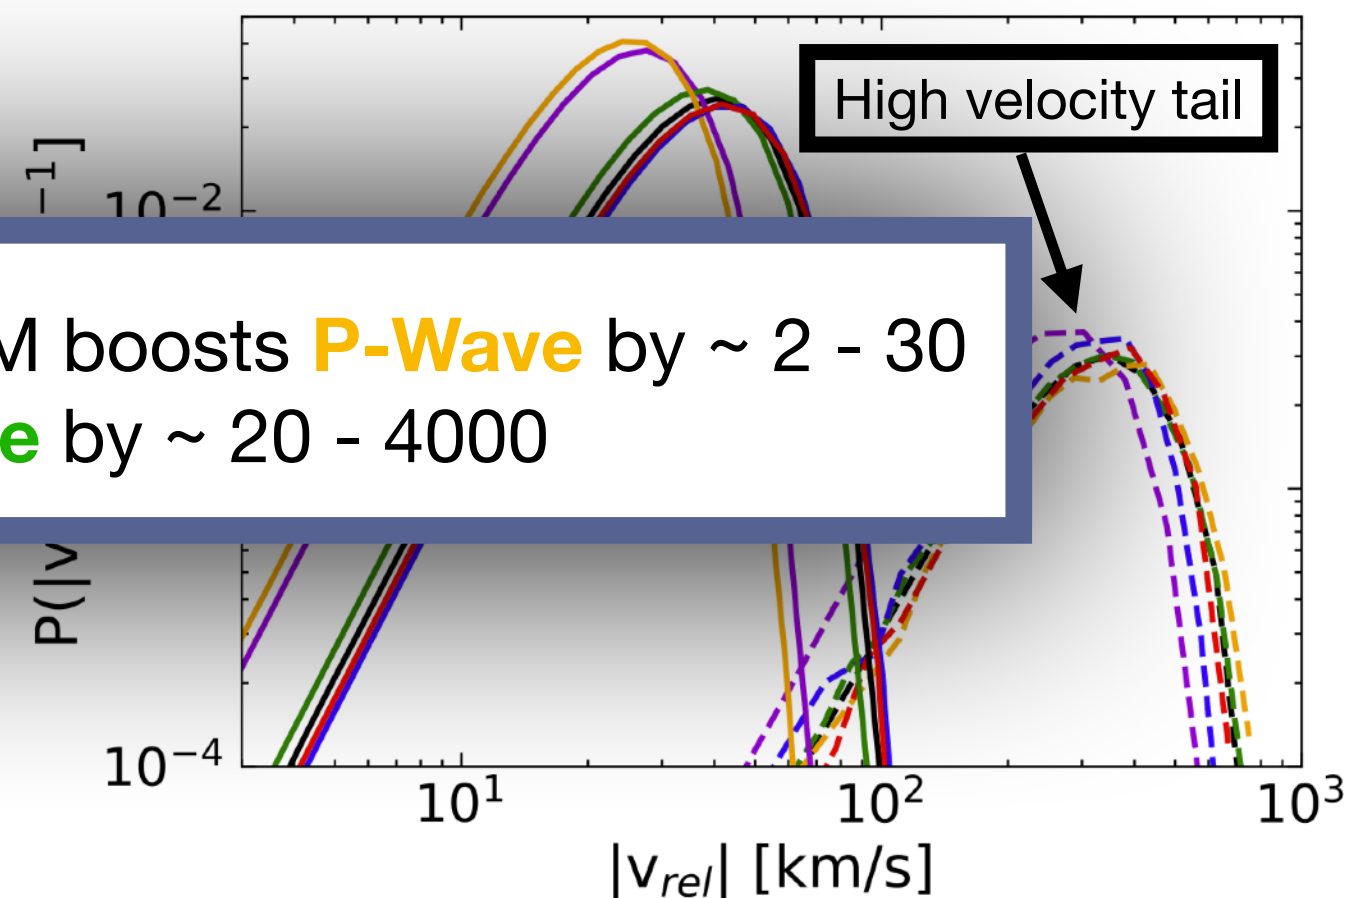

# Impact of unbound MW DM

- There are two populations of DM within a subhalo:
  - DM that is bound to the subhalo
  - DM that is bound to the MW (not bound to subhalo)**

Density Profiles

Relative Velocity Distribution

For Sgr, the unbound DM boosts **P-Wave** by  $\sim 2 - 30$   
and **D-Wave** by  $\sim 20 - 4000$

# Further Quantifying the Boost

- In a follow up study, we investigated this boost for  $\sim 900$  resolved subhalos from the Auriga simulations

# Further Quantifying the Boost

- In a follow up study, we investigated this boost for  $\sim 900$  resolved subhalos from the Auriga simulations
- Identified the correlation with galactocentric distance

P-wave

D-wave

# Impact on Exclusion Limits

- Determined the predicted boost for **Ursa Major II** and **Segue I**
- Recomputed **P-Wave** and **D-Wave** exclusion limits, taking into account unbound MW DM particles

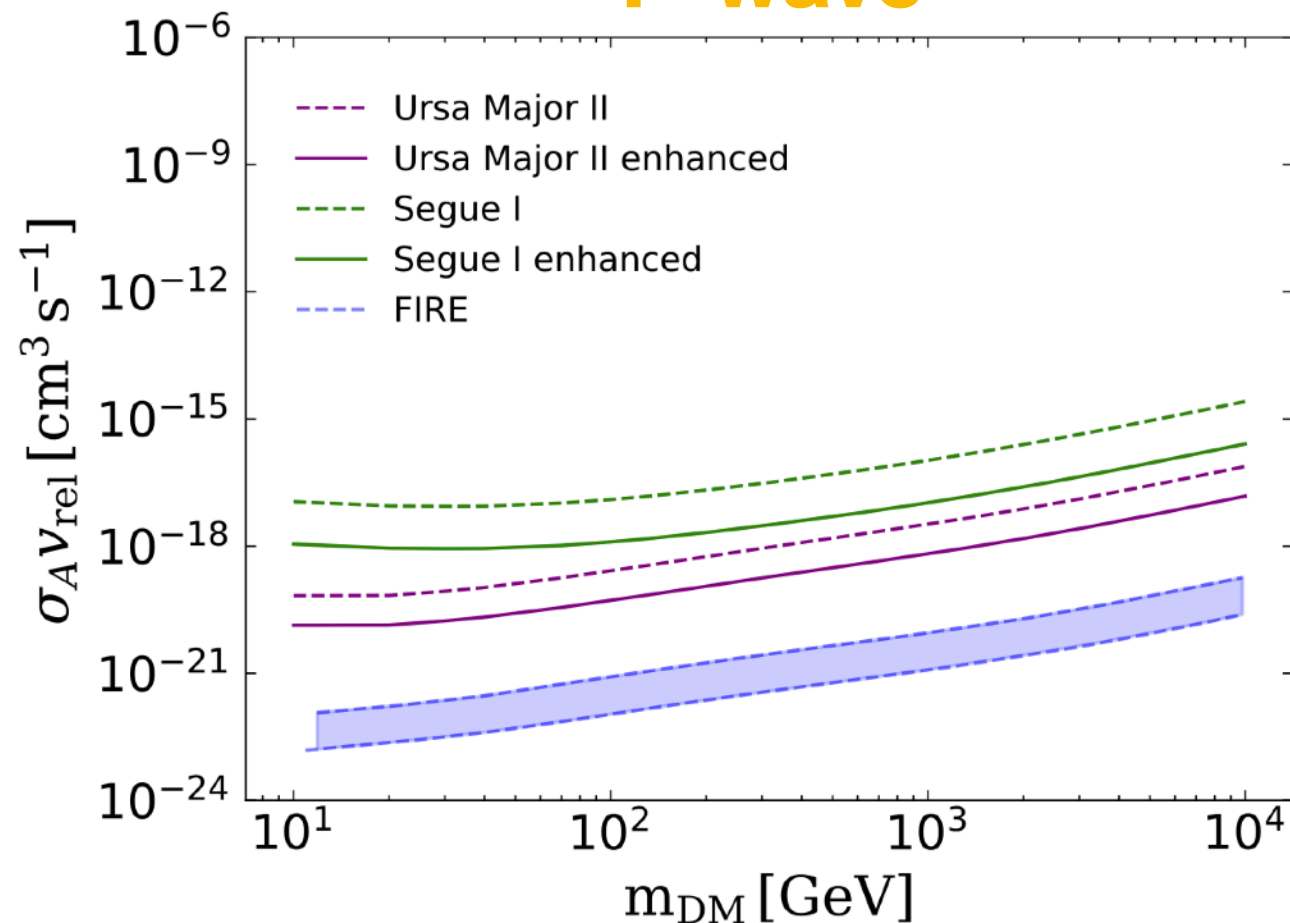

## P-wave

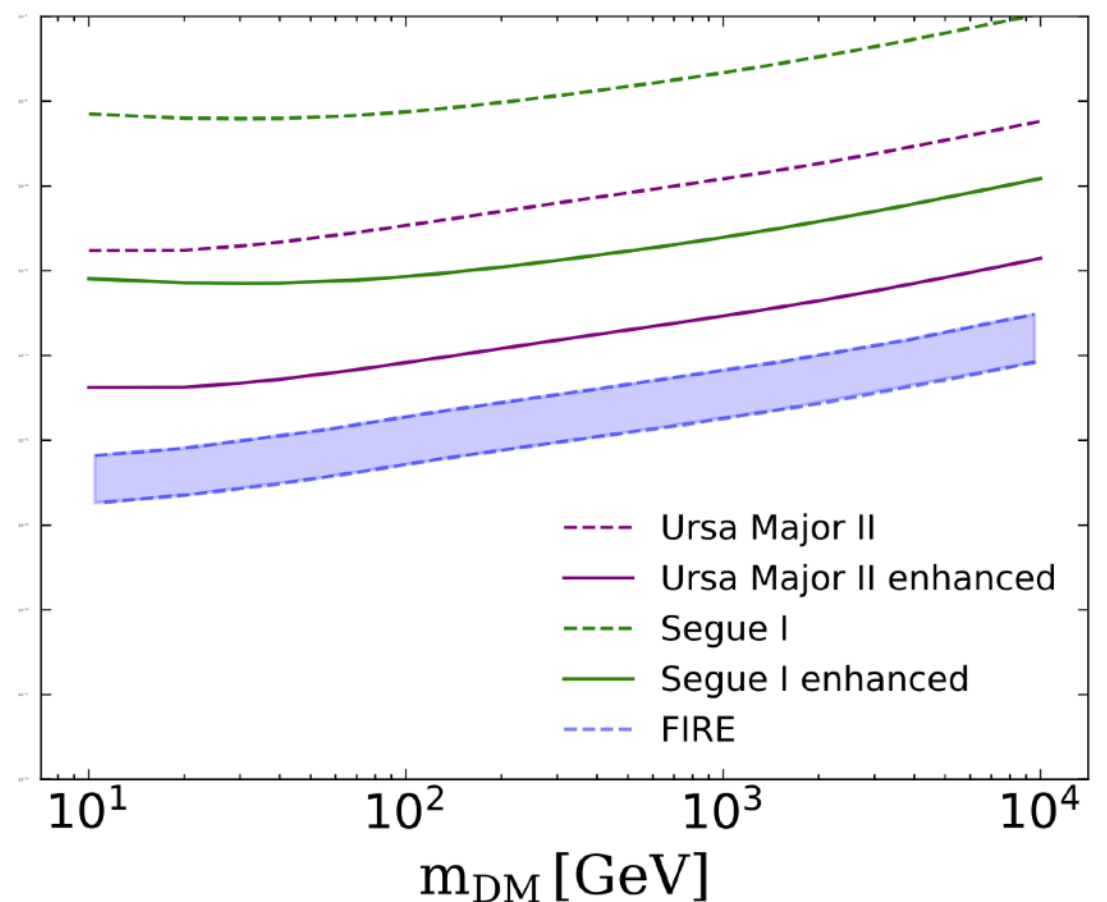

# Impact on Exclusion Limits

- Determined the predicted boost for **Ursa Major II** and **Segue I**
- Recomputed **P-Wave** and **D-Wave** exclusion limits, taking into account unbound MW DM particles

## P-wave

## D-wave

# Conclusions

- DM annihilation emission from the MW foreground is larger than the emission from Sgr for all annihilation models except for **Sommerfeld**

# Conclusions

- DM annihilation emission from the MW foreground is larger than the emission from Sgr for all annihilation models except for **Sommerfeld**
- Spatial morphology of predicted DM emission from Sgr is likely too extended to explain observed point-like emission

# Conclusions

- DM annihilation emission from the MW foreground is larger than the emission from Sgr for all annihilation models except for **Sommerfeld**
- Spatial morphology of predicted DM emission from Sgr is likely too extended to explain observed point-like emission
- Unbound MW DM particles within MW subhalos can boost the expected **P-Wave** and **D-Wave** annihilation rates by up to a factor of  $\sim 10^{1.7}$  and  $\sim 10^{4.7}$

# Conclusions

- DM annihilation emission from the MW foreground is larger than the emission from Sgr for all annihilation models except for **Sommerfeld**
- Spatial morphology of predicted DM emission from Sgr is likely too extended to explain observed point-like emission
- Unbound MW DM particles within MW subhalos can boost the expected **P-Wave** and **D-Wave** annihilation rates by up to a factor of  $\sim 10^{1.7}$  and  $\sim 10^{4.7}$
- Exclusion limits for Ursa Major III and Segue I are strengthened by  $\sim$  an order of magnitude for **P-Wave** and  $\sim$  four orders of magnitude for **D-Wave**

# Conclusions
